ATLAS · DEVELOPER HANDOFF · PROTOTYPE, NOT PRODUCTION CODE

Atlas: “Sorpresa” locked places

How the Atlas shows places a user has not reached yet. Only the next two places tease with a blurred photo and a “?”. Everything further ahead is a small coloured dot, and its name and photo stay hidden until the user gets there.

Chosen 2026-10-26: Sorpresa, “Maché natural” globe, “Postal garabato” postcards, big globe in every view

Copy: Spanish (EN to follow) Interactive prototype (final) The 4 directions, for context PDF of this page

Screens

World. Done and current places are photo pins. The next places are blurred pins with “?”. Further places are dots.

Zone. The globe stays full size and turns to the area. The postcard panel sits below it. The postcards follow the same rules: a teaser shows a blurred photo and the country only.

Place sheet. Opening a hidden place never shows its name, photo or blurb.

List ("Ver lista"). This is the accessible version of the globe, with the same hiding rules.

Chosen look

- **Globe:** "Maché natural". The sea is one blue with undyed cream paper strips over it. Land is tinted in the area colour (grey until the area is started). Seams, a soft rim shadow and a paper-grain overlay. No rainbow.
- **Size:** 352 px across (radius 176) on a 390 px-wide screen, in both the world and zone views. In the zone view it only moves (centre at y 250 within the 500 px globe canvas) and rotates to the area. Keep it from feeling busy: other areas' places show only as dots while a zone is open.
- **Postcards:** "Postal garabato", 128 px wide. Torn paper edge, a hand-drawn frame in the area colour, a dotted stamp with the week number, name and country on one line each (they shorten with "…"). The row scrolls sideways and snaps.

The rule

Each place has a state from the user's progress, plus an order (`o`, 0-based) inside its area of life. Places inside an area open in order.

```
state(place)  ∈ done | current | open | locked          // from backend progress
lockRank(p)   = count of locked places in p.area with o < p.o
isTeaser(p)   = state(p) == locked
                && lockRank(p) < (areaStarted(p.area) ? 2 : 1)
isHidden(p)   = state(p) == locked && !isTeaser(p)
areaStarted(a)= any place in a is done or current
```

So a started area teases its next **two** places. An area that hasn't been started teases only its **first** place, so every area always shows at least one "?".

What each state looks like

STATE	GLOBE PIN	ZONE POSTCARD	PLACE SHEET	LIST ROW
done	Photo medallion, area-colour ring, green check	Photo, name, "País · Recorrido"	Full content. CTA "Volver a recorrer"	Photo, name, "Recorrido"
current	Photo medallion with a pulsing ring (static if reduced motion)	Photo, name, "País · En curso"	Full content. CTA "Seguir donde lo dejaste"	"En curso"
open	Photo medallion, no badge	Photo, name, "País · Abierto"	Full content. CTA "Empezar este lugar"	"Abierto"
teaser	Photo blurred (~2.6px at pin size, saturation 0.75, 28% warm veil) and a "?" badge in the area colour, top-right	Blurred photo (3px). Title "Por descubrir", sub "Siguiente · País" or "Después · País"	Hero blurred 5px. Title "¿Qué habrá en País?". Blurb shown. CTA disabled: "Se abre cuando llegues aquí"	Blurred thumb, "Por descubrir · País", "Sorpresa"
hidden	Dot, 3.2px radius, area colour at 80%. Not tappable	No photo. Dashed paper block with "?". Title "Semana N", sub "Sorpresa"	Hero blurred 14px. Title "Lugar por descubrir", sub "Área · Semana N de M", blurb replaced (see copy). CTA disabled	Blurred thumb, "Lugar por descubrir", "Sorpresa"

Areas that haven't been started draw their land and labels in grey. A teaser in such an area still uses the area's real colour, so it reads as an invitation rather than a dead end.

Copy (Spanish, as in the prototype)

WHERE	STRING	NOTES
Teaser postcard title	Por descubrir	
Teaser postcard sub	Siguiente · {país} / Después · {país}	"Siguiente" for lockRank 0, "Después" for 1
Hidden postcard	Semana {n} · Sorpresa	No name, no country
Teaser sheet title	¿Qué habrá en {país}?	

WHERE	STRING	NOTES
Hidden sheet title	Lugar por descubrir	Also the list label and image alt text
Hidden sheet blurb	Se revela cuando llegues. Cada lugar que terminas abre el siguiente.	
Locked CTA (disabled)	Se abre cuando llegues aquí	Don't name the previous place. It may be a teaser itself
“Leer más” path	Lago Moraine → Yosemite → Golden Gate → ? → ?	Teaser and hidden names show as “?”
List status	Sorpresa	Replaces “Bloqueado”

Behaviour and edge cases

- **One tap opens.** Tapping a postcard or a globe pin opens the place sheet straight away. The postcard row scrolls sideways, and a scroll never opens anything.
- **Dots aren't tappable.** The area still opens by tapping its land, its label or its area card.
- **Pins near the rim.** A pin facing less than about 0.32 toward the viewer becomes a dot. After pins are pushed apart so they don't overlap, they're clamped inside the globe edge so none hang off it. This applies to every state except the selected place.
- **No leaks.** Hidden names and photos must not appear in alt text, accessibility labels, the list, “Leer más”, search, push notifications or share images. Ideally the API doesn't send them to the client at all until a place becomes a teaser.
- **Reveal moment.** When a place goes from teaser to open, unblur the photo, drop the “?” and play a short pop (skip it if reduced motion is on). The place after it becomes the new teaser. This moment isn't built in the prototype.
- **Accessibility.** The globe is a canvas, so the list is the screen-reader path. A teaser pin's label reads “Lugar sorpresa en {país}, siguiente”. Hidden places are grouped as “{n} lugares por descubrir” instead of one row each, if the list feels long to people using VoiceOver or TalkBack.
- **Small screens.** At 320 px the zone title shortens with “…” and the postcard names are one line with “…”.

Checked: what's still missing

I went through the Atlas prototype for anything a build would trip on. Green is done in the prototype, amber needs a product decision, and red needs content or assets.

fixed

Hidden names were leaking

“Ver lista” and “Leer más” showed the names and photos of hidden places. Both now follow the rule, checked with a script.

fixed

The list scrolled under the header

The list now starts below the “Tu Atlas” header and the “Ver mapa” button.

decide

How areas open

In the sample data only Asia and North America have progress. Every place in Europe, South America and Africa is locked, so there's no way in. Decide whether all five areas start open (first place open), open one at a time, or open after a set number of weeks.

decide

Places per area aren't 8 everywhere

Counts now: Asia 6, Europe 5, South America 5, North America 10, Africa 10. The prototype assumes 8 (“2 de 8”, “Semana N de 8”, 8-segment bars, “Pronto” fillers, and “Lugar extra” after 8). Agreed direction: uneven counts per area, minimum 6. Every “de 8” should become “de {total of the area}”.

decide

Oceania

Proposed as part of Asia · Dinero y seguridad (Uluru and Milford Sound). The land is drawn on the globe but has no places yet.

decided

Globe and postcard look

“Maché natural” globe, “Postal garabato” postcards, and the globe stays big when you open an area.

content

Photos still to come (Codex prompt sent)

Europe: Provence and Cinque Terre. South America: Iguazú and Valparaíso. Oceania: Uluru and Milford Sound. Optional spares: Hallstatt, Uyuni, Great Barrier Reef. Also Lan Hạ week 1 day 7 (scheduled 2026-11-01).

content

Image sizes for production

The prototype uses 240 px pin and postcard thumbnails and 680×400 sheet heroes. Ship at least 2×: 480 px square thumbnails and 1360×800 heroes. Blur on the device. Never ship a pre-blurred copy alongside the sharp one.

content

English copy

All Atlas strings are Spanish only, including the 35 place blurbs and the 5 “Lo que aprenderás” lists. They need English versions and Alejandra's review of the Spanish.

content

Journey questions for weeks 7–9

Europe, South America and Africa still use placeholder questions copied from week 5. This doesn't block the Atlas, but the CTA starts those journeys.

build

Not in the prototype

The reveal animation, the “Seguir” card's behaviour when nothing is in progress, offline and loading states for the globe, and analytics events (teaser tapped, hidden tapped, reveal seen).

Data the client needs

```
Area   { id, name_es, region_es, color, tint, places: Place[] (ordered) }
Place  { id, areaId, order, state,                    // always
         country_es,                                  // teaser and up
         name_es, blurb_es, thumbUrl, heroUrl, lat, lon,  // teaser: thumb/hero only (to blur);
       }                                              // hidden: none of these
Pins for hidden places only need lat/lon, colour and order.
```

The prototype computes everything on the client from one static list. That's fine for a prototype, but not for production, because it ships every hidden name and photo to the phone.
